UROSAN PLAN PET is a product specifically formulated to provide correct and balanced diet in the treatment and prevention of the formation of struvite stones.

The struvite stones are magnesium ammonium phosphate crystals that are formed due to the presence of magnesium, phosphorus and ammonia in the urinary tract. The formation of these crystals is favored by an alkaline pH. Struvite stones can block the urinary tract, causing a worsening of the health condition of the animal. The urinary tract obstruction is much more common in cats than in dogs. A proper nutrition in animals is very important to prevent and treat the presence of struvite stones.

The diet should:
- Be very digestible and rich in calories
- Produce urine slightly acidic (pH 6.0 to 6.5)
- Contain low levels of magnesium (≤ 0.1% based on dry substance)
- Contain ingredients of animal origin as sources of protein

UROSAN PLAN PET will:
- maintain urinary pH acid
- ensure a rich and balanced diet
- increase urine volume

UROSAN PLAN PET is a product that contains the appropriate value for the vitamins A, D3 and E, which fall within the normal constitution of the cells and the lack of which reflects negatively on the general state of health.

- **Vitamin A** participates in the formation of mucopolysaccharides of the intestinal mucosa, the establishment of the condroitin sulphuric acid in bones, in the generation of progesterone and in the biosynthesis of hormones that regulate water, electrolyte balance and metabolism of carbohydrates.
- **Vitamin D3** has a significant importance as in animals, especially the young ones, preside over the replacement of calcium and phosphorus and regulates the phenomena of bone calcification.
- **Vitamin E** stimulates and controls cell tropism, the intermediary metabolism of proteins, lipids, glucose and inorganic elements, especially by means of its antioxidant properties.

**DIRECTIONS FOR USE**

Mix UROSAN PLAN PET with traditional food. Please, after mixing, do not cook the food otherwise contained nutritive principles would be altered.

**1° Administration**: 1 month.

Daily administration of 1 g/kg body weight up to 22 kg body weight of the subject.

Over 22 kg, the maximum daily dose is 22 g.
